Graduate Studies in Chemistry & Biochemistry Frequently Asked Questions

What is the yearly stipend for graduate students in your program?

The stipend for the 2018-2019 academic year is \$24,000.

Do I pay my own tuition?

No, the department will cover your tuition.

How long is a typical Ph.D. program?

The department average is 4.7 years to complete the program.

Do you have a joint MD/PhD program?

No.

Do you have a masters program?

We only admit students interested in completing a Ph.D. because it is the degree most desired by employers.

Do you have forensic or environmental chemistry programs?

Forensic and environmental chemistry are not separate programs, but we do have clusters of faculty involved in each area.

What is your policy for transfer students entering the Ph.D. program (with or without a M.S. degree)?

Once a transfer student chooses an advisor, the advisor can determine whether courses taken elsewhere may be transferred. Until an advisor is chosen, transfer students follow the same program as other entering students.

Do you have an REU program?

No, but we do offer fellowships to entering graduate students during the summer before they enter our graduate program.

Do you have any connection to biomedical sciences or the USC School of Medicine?

We have a strong biochemistry division that is involved in biomedical research, which includes collaborations with research groups at the USC School of Medicine. Some of our faculty also participate in the Integrated Biomedical Sciences program that allows students to choose a research group from a variety of research labs in colleges and schools across USC.

When and how do students join research groups?

Students choose research advisors at the end of the first semester, after seeing brief seminars from all faculty and participating in a faculty interview process.

What is a typical group size?

The department average is just over 4 students per group.

What type of housing is available in Columbia, SC?

There is some on-campus housing for graduate students, but most students find housing within 15 minutes of campus in single or shared apartments and houses.

How do I apply?

Application is free. You can start with 2-3 recommenders, unofficial transcripts and GRE scores (TOEFL if international).

Visit www.sc.edu/chemistry >> [Apply](#).

Michael Angel

My group develops new types of remote and in-situ laser spectroscopic techniques for use in extreme environments with applications to deep-ocean and planetary exploration.

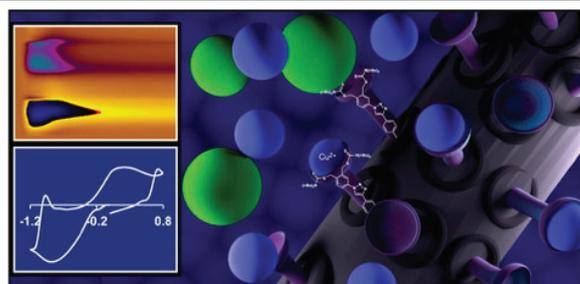

John Ferry

My group studies how natural and technological processes can work to remove trace organic chemicals from the environment. The role of sunlight and surfaces are particularly important in our research.

Parastoo Hashemi

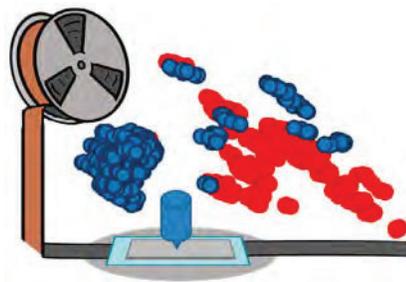

We investigate the fundamental chemistry underlying psychiatric diseases using ultra microelectrode probes implanted in brain tissue. Real-time neurotransmitters measurements are combined with animal behavior and mathematical modeling to relate chemical changes to these disorders.

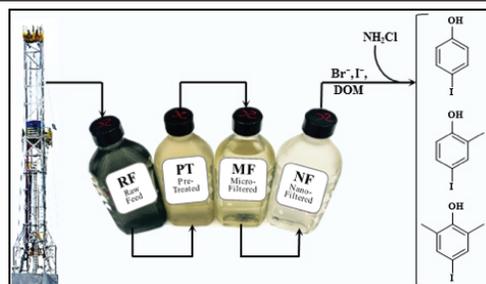

Stephen Morgan

Our research has focused on forensic research including fibers, toxicology, and thermal imaging of blood at crimes scenes. Another recent project used IR spectroscopy with computer-age modeling to detect magnetic tape degradation in archived tapes prior to restoration processes.

Susan Richardson

We study disinfection by-products and other emerging environmental contaminants in water to solve important human health and environmental issues. We use GC/MS and LC/MS to identify unknown contaminants and quantify toxicologically important ones.

Timothy Shaw

The analytical/environmental chemistry laboratory combines analytical method development with environmental applications such as transport and cycling of trace elements associated with icebergs, seawater and submarine ground waters.

Maksymilian Chruszcz

We specialize in protein chemistry and structural biology, focusing on the analysis of allergens to determine the molecular basis of allergic diseases. Moreover, we study proteins that are targets for the development of antibiotics and pesticides.

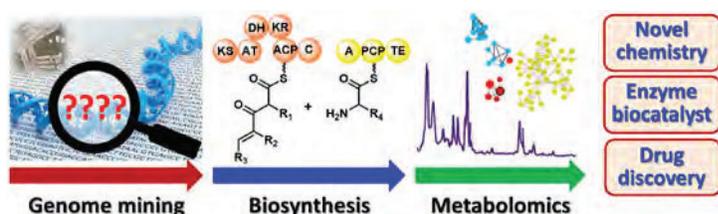

Mythreye Karthikeyan

We are understanding mechanisms and consequences of altered growth factor availability and signaling in physiology and disease with an emphasis on tumor progression and metastasis. Our approach is cross-disciplinary with an overall mission to discover innovative therapeutic avenues.

Jie Li

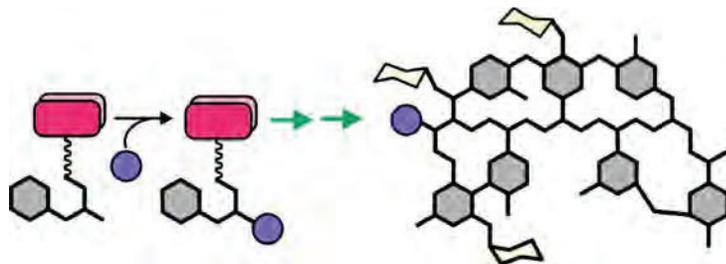

We focus on drug discovery and enzyme biocatalyst development using microbial genome mining and biosynthesis. Our interdisciplinary approach includes organic chemistry, natural products chemistry, biochemistry, metabolomics, genetic engineering, and synthetic biology.

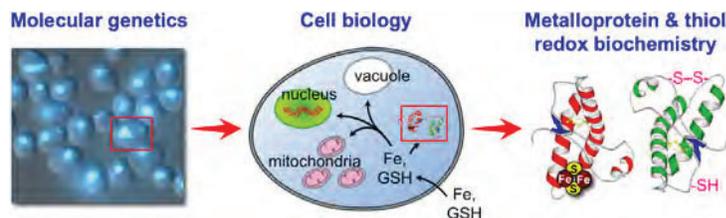

Thomas Makris

We are leveraging enzyme catalysts to synthesize novel therapeutics and sustainable fuels.

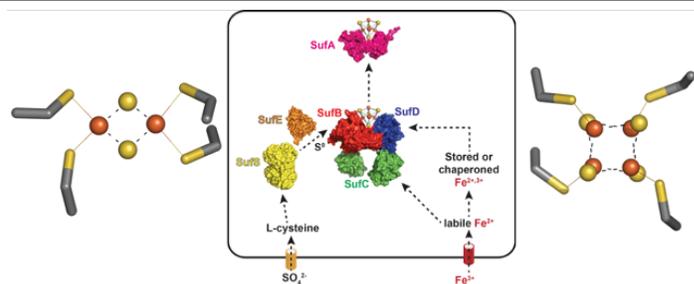

Caryn Outten

We study how cells regulate the essential metal iron and control thiol-disulfide balance using yeast as a model system. We employ a multidisciplinary approach that includes protein biochemistry, molecular genetics, and cell biology.

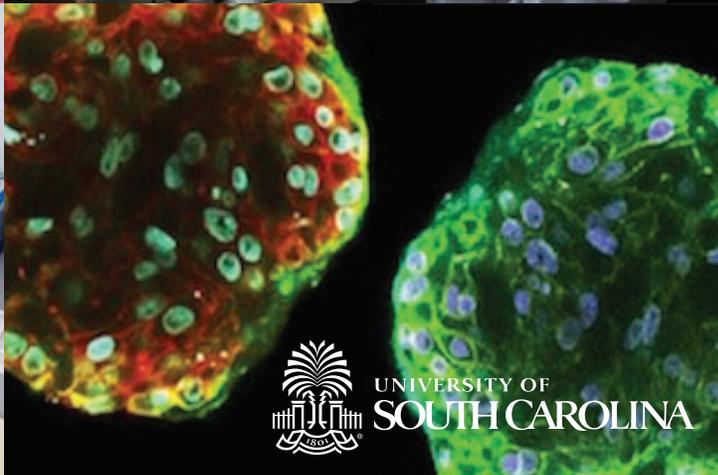

F. Wayne Outten

We study the homeostasis and metabolism of essential metals like copper, iron and zinc, with the goals of disrupting metal metabolism in bacteria during infection and correcting defects in human metal metabolism that lead to disease.

Richard Adams

Our research is focused on the organometallic chemistry of polynuclear metal complexes for the activation of C-H bonds and for the formation of catalysts for the selective oxidation of hydrocarbons to higher-value organic compounds.

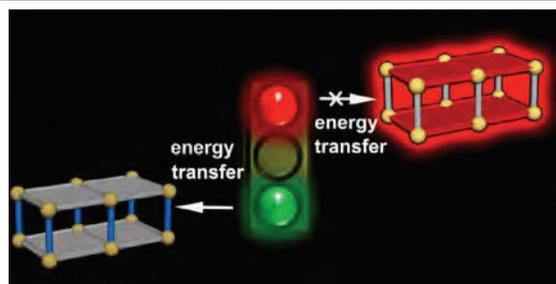

Dmitry Peryshkov

We design and make new molecular catalysts for activation of important substrates such as dihydrogen, carbon dioxide, and unsaturated organic compounds. Our focus is on renewable energy, catalysis, inorganic, and organometallic chemistry.

Natalia Shustova

We design photoswitches, artificial biomimetic systems, and materials for sustainable energy conversion based on porous graphitic frameworks.

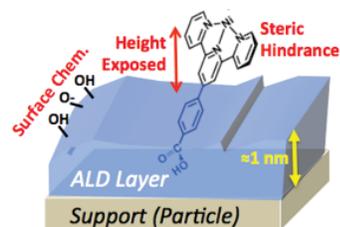

Aaron Vannucci

We design methodologies for sustainable catalysis that cross the divide between homogeneous and heterogeneous catalysis. Our interests include photoredox cross-coupling, lignin biomass conversions, and photoelectrochemical production of renewable fuels.

Hybrid Heterogeneous Catalyst

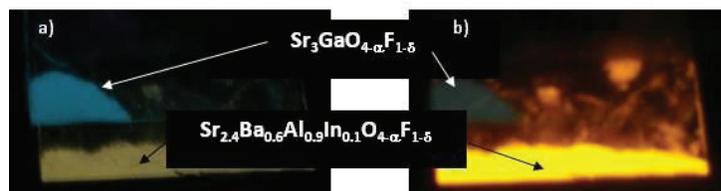

Thomas Vogt

We make novel metal oxides and nanoparticles and determine their atomic structures using electron, X-ray, and neutron scattering and explore their unique electrical, magnetic, dielectric, optical and photocatalytic properties.

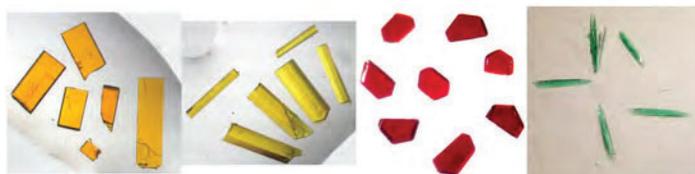

Under 254 nm UV

Under 365 nm UV

Hans-Conrad zur Loye

We investigate the crystal growth of new materials, including new scintillating and luminescing oxides and fluorides, and new uranium and thorium containing structures. For the latter, we synthesize new hierarchical wasteform materials for the effective immobilization of nuclear waste.

Brian Benicewicz

We design and synthesize new functional polymers to study structure-property relationships in polymer nanocomposites and fuel cell-membrane applications.

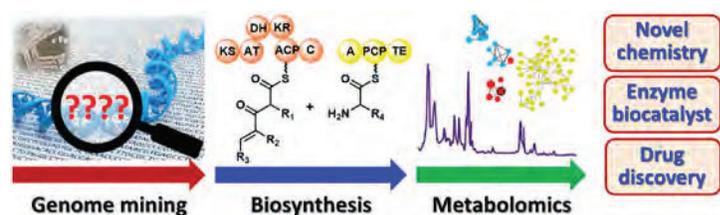

John Lavigne

Our research is centered on supramolecular organic and organometallic chemistries. More specifically, we are using boronic acids to assemble new polymeric networks, and conjugated polymers as sensors in biological assays.

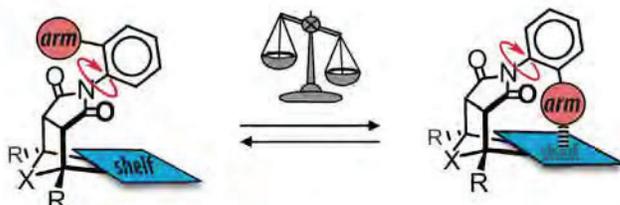

Jie Li

We focus on drug discovery and enzyme biocatalyst development using microbial genome mining and biosynthesis. Our interdisciplinary approach includes organic chemistry, natural products chemistry, biochemistry, metabolomics, genetic engineering, and synthetic biology.

Ken Shimizu

We make molecular devices such as molecular rotors, switches, and balances to measure weak non-covalent interactions. We also make molecularly-imprinted polymers for sensing and separation applications.

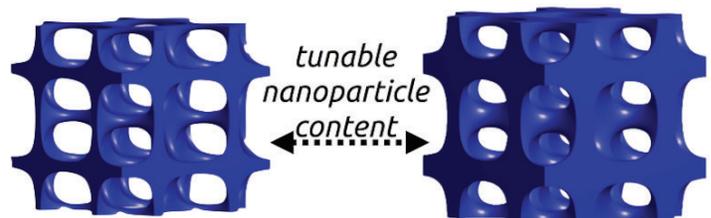

Linda Shimizu

We are interested in developing macrocycles that self-assemble in high fidelity to give porous functional materials. These porous molecular crystals can bind guests and facilitate their subsequent photooxidations, polymerizations or photodimerizations.

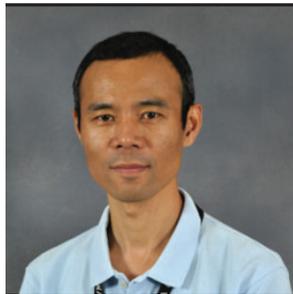

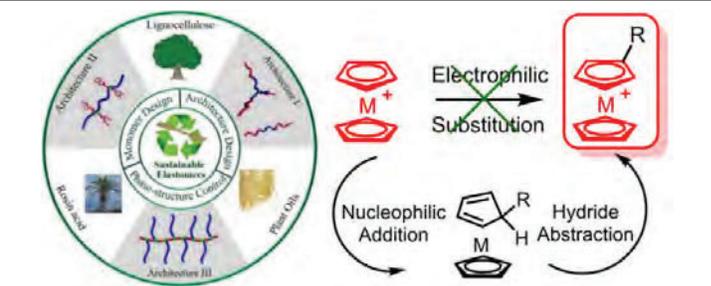

Morgan Stefik

We are developing new polymer-based methods to control the fabrication of advanced nanomaterials. The novel material chemistries we develop are taken from concept through to functioning devices such as fuel cells, batteries, supercapacitors, photovoltaics, and solar fuels.

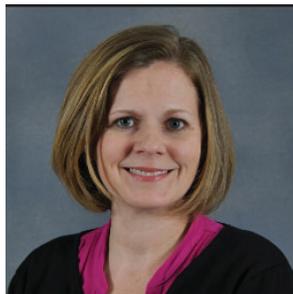

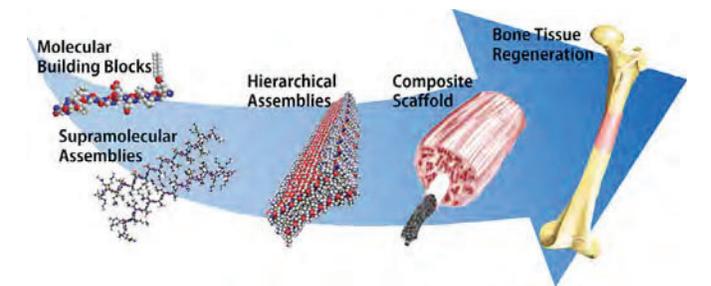

Chuanbing Tang

Our research is focused on designing novel macromolecular topologies and compositions for sustainable bio-based polymers and biomaterials from natural resources, metal-containing polymers, as well as advanced polymeric materials for biomedical and energy applications.

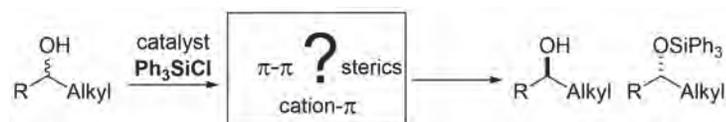

Qian Wang

Our research is focused on bioconjugation chemistry and biomaterials development. We are exploring novel synthetic and biological methods in order to create materials and functionalities at the nanometer scale.

Sheryl Wiskur

Our research focuses on synthetic organic methodology and mechanistic investigations. When developing new reactions, we also want to thoroughly understand what is happening in the reaction and what intermolecular forces control selectivity.

Vitaly Rassolov

We study quantum effects in chemistry that range from strongly correlated molecular systems, for which the standard Density Functional Theory electronic structure models fail, to semiclassical effects of nuclear motion. Two complementary theoretical approaches are developed in the group.

Reactive singlet geminal of para-benzyne

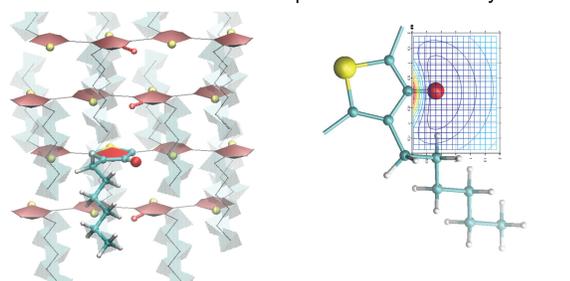

Comparison of classical (without the Quantum Potential, QP) and quantum dynamics

Sophya Garashchuk

We study dynamics and properties of complex molecular systems, often in collaboration with experimental groups, and develop theoretical and computational approaches which incorporate the nuclear quantum effects into the classical-like framework of molecular dynamics.

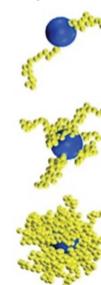

H/D isotope effect in a polymeric crystal

Ting Ge

The group perform computational and theoretical research in polymer physics. The goal is to understand the conformations and dynamics of polymers on the microscopic level and the connections to macroscopic material properties, such as the mechanical and rheological responses.

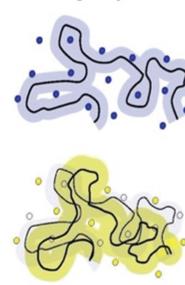

Polymer-tethered Nanoparticles

Mechanical Failure at Polymer Interfaces

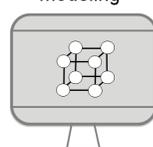

Rheology of Ring Polymers

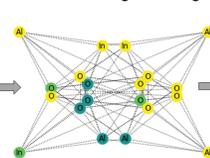

Chris Sutton

Our research combines first-principles theory and machine learning methods for the design and discovery of new materials for energy production and storage applications. A particular focus of our research is identifying regions of low errors/uncertainties in our predictions (i.e., their “domain of applicability”).
